

Figure 2: a) The R₂ and Q₂ values of internal cross-validation of the different COMBINE models were plotted in dependency of the number of latent variables (LV). (For more details see legend of table 1).

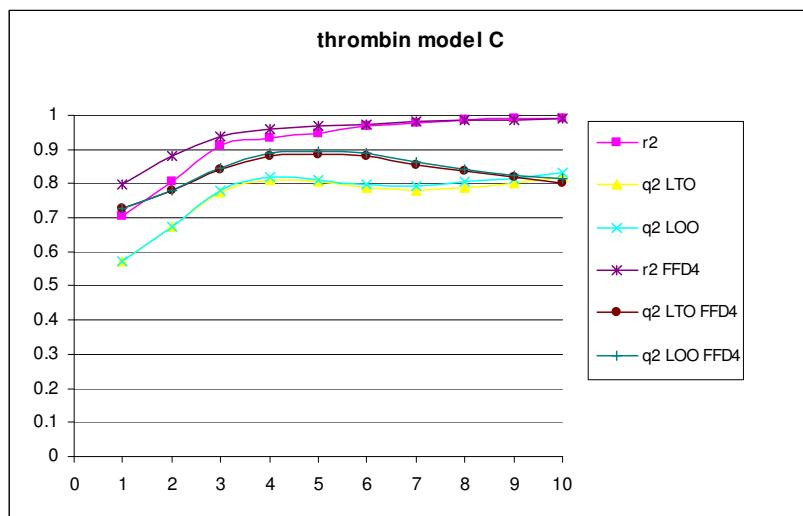

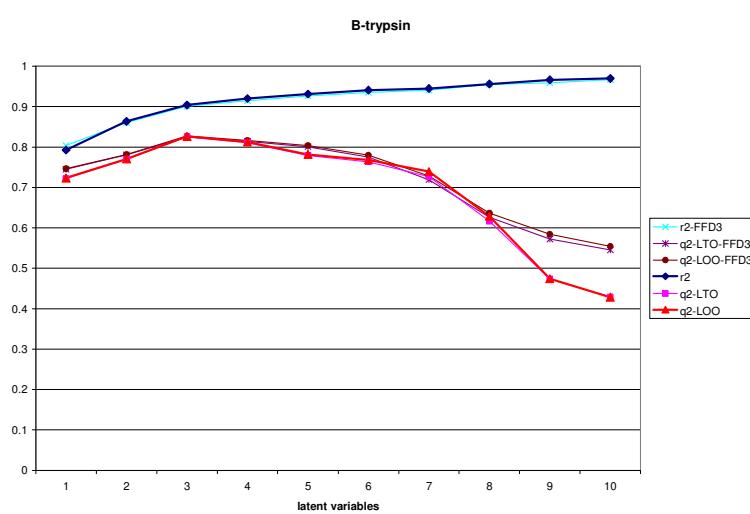

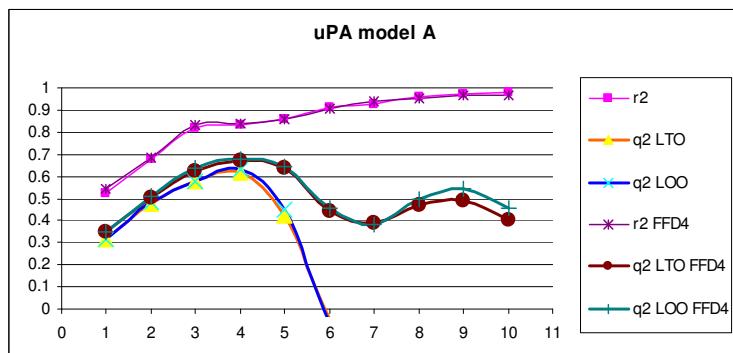

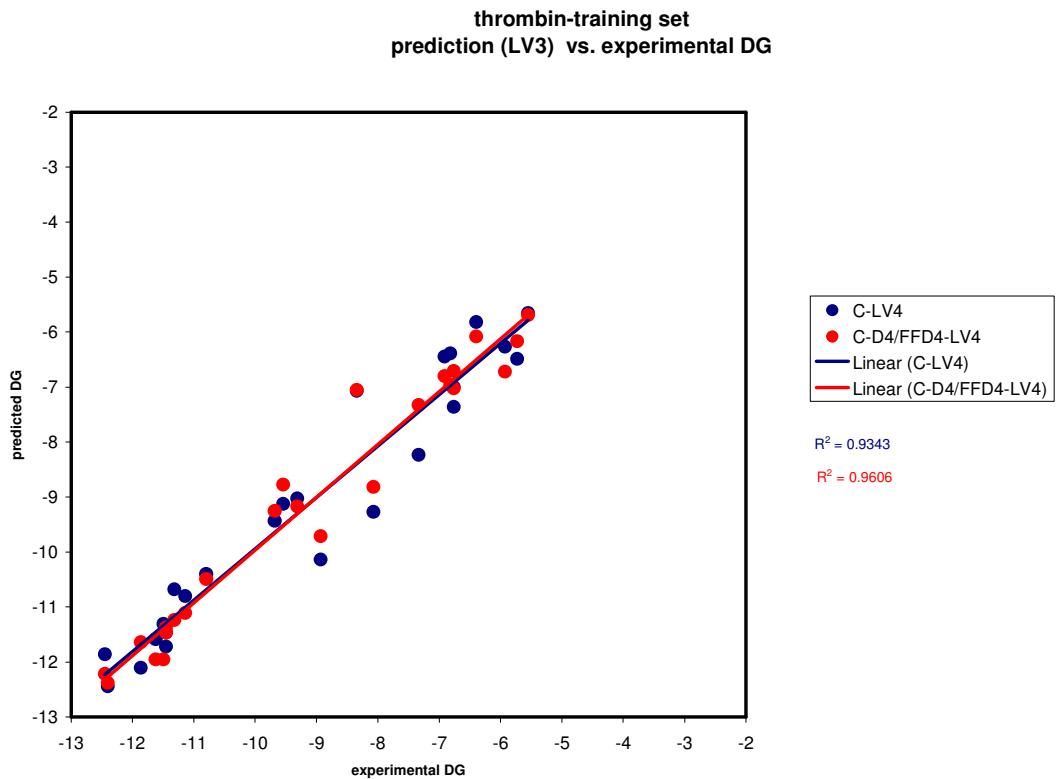

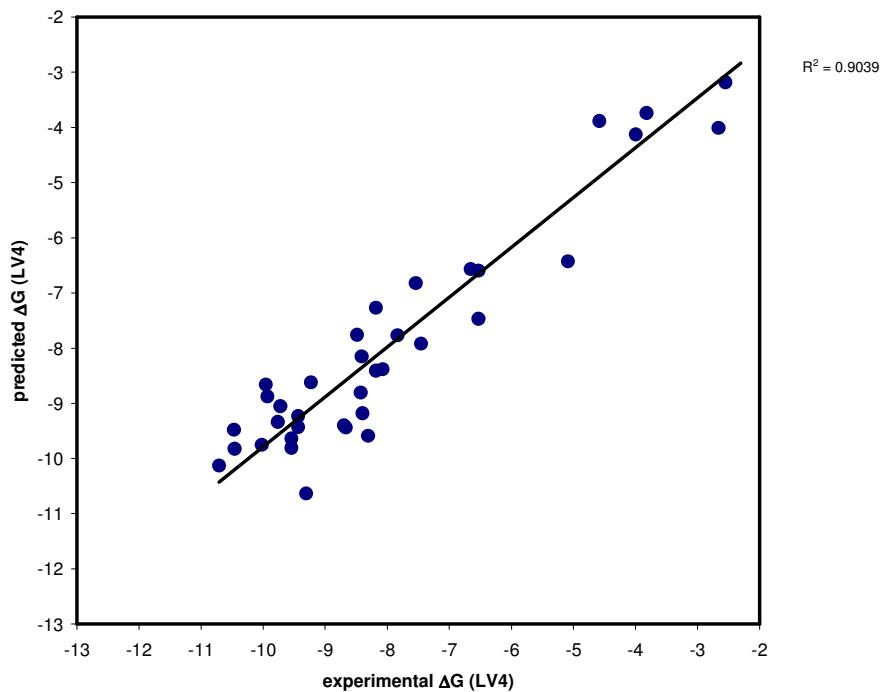

Figure 2: b) Predicted versus experimental binding free energy ΔG in kcal/mol. For the COMBINE models of urokinase and thrombin latent variable 4 were chosen before (blue dots) and after variable selection (red dots). For trypsin the best model could be reached at latent variable 3 without any variable selection. The R² values based on the plots are given in the figures and in table 1.

b1) thrombin

b2) trypsin

trypsin-training set
prediction (LV3) vs. experimental ΔG

b3) urokinase

urokinase-training set
prediction (LV4) vs. experimental DG
